IRON,STEEL,PCCP

CORROSION

IRON OXIDE

# Corrosion Process

# *Internal & External Corrosion of Force Mains....*

# 24" Ductile Iron Force Main

- ◆ Internal failure following loss of internal mortar lining
- ◆ Failure was along top of pipe due to formation of hydrogen sulfide gas

# Dual 26" Force Mains

- ◆ Internal failures at bottom of pipe
- ◆ Failure following loss of internal mortar lining
- ◆ Failures concentrated at low areas (dips) in pipeline alignment
- ◆ Cause is corrosion under accumulated solids

# 36" Above Ground Crossing

- Failure of force main at above ground crossing
- Crown of pipe attacked by hydrogen sulfide gas

# External Corrosion

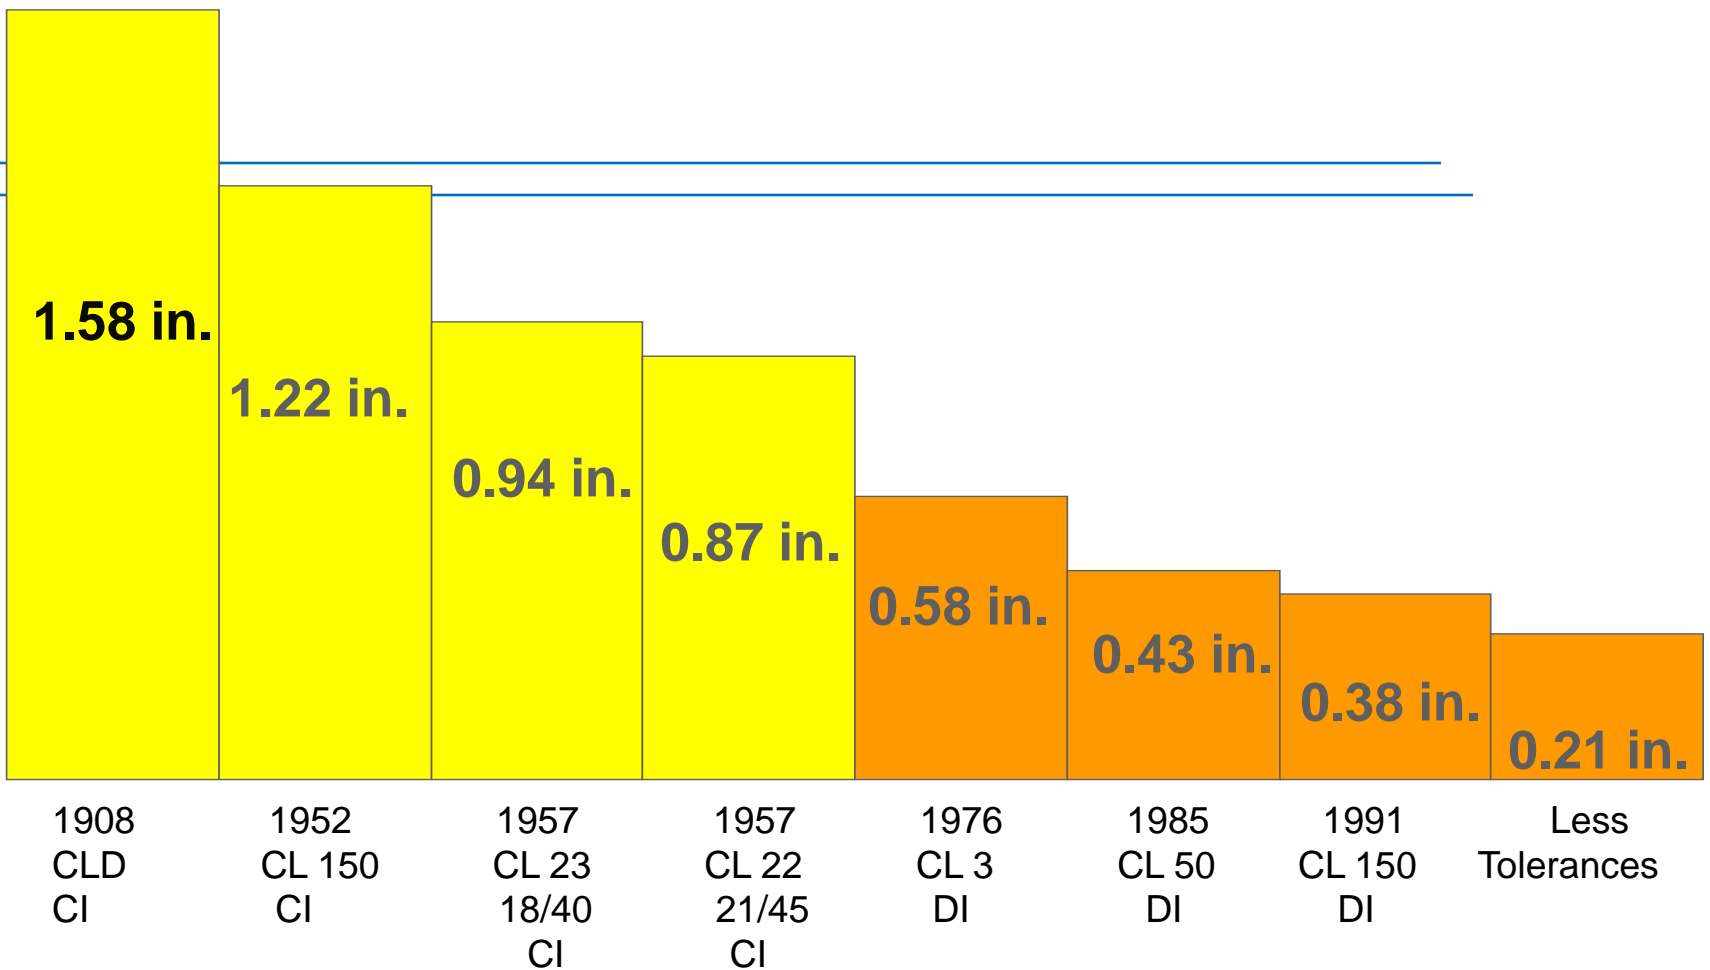

- ◆ Caused by Aggressive soil conditions
- ◆ Galvanic Corrosion
- ◆ Stray DC Currents

# External Corrosion Attack

Actual size of AWWA Specification Thickness Reductions  
 for 36-inch Diameter Cast and Ductile Iron Pipe - 1908 to Present  
 (150 PSI Operating pressure)

# Cast Iron Pipe (thicker walled pipe)

**External pitting  
(concentrated) corrosion  
attack on thinner walled  
ductile iron pipe.**

# Temporary Fix ?

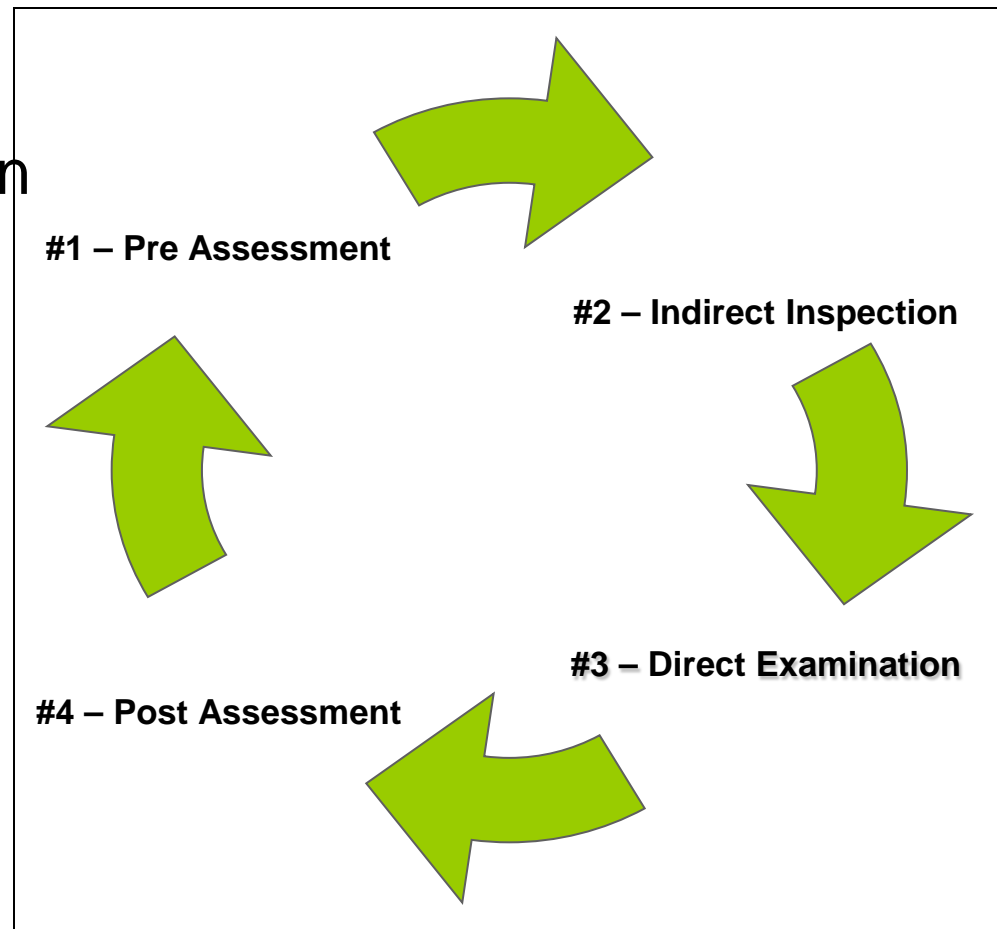

- ◆ The rate and magnitude of corrosion depends on a number of factors:
  - ◆ Pipe Material and Characteristics
  - ◆ Operating Conditions
  - ◆ Construction Methods
  - ◆ Environment (age not a good primary metric)
  - ◆ Internal or External Corrosion Attack

# Pipeline Condition Assessment Process

- ◆ Initial development driven by federally regulated pipeline integrity rules
- ◆ Methodology also quite applicable to water / wastewater

## #1 Pre-Assessment:

- ◆ Define pipe segments by construction contracts and similar characteristics, e.g. material, construction practices
- ◆ Identify specific locations along the pipeline
  - ◆ Air Release Points/Man ways
  - ◆ Pipeline crossings
  - ◆ Known area where piping failures have occurred

# #1 -Pre-Assessment Data Gathering & Planning:

- ◆ “Good listening” – operating history, criticality, consequences of failure
- ◆ Leak & Repair Records
- ◆ Pipe “Bone Yard”
- ◆ Coordination of Condition Assessment Efforts With Other Activities
  - ◆ Excavations
  - ◆ Repairs
- ◆ Project construction drawings and specifications
- ◆ Pipe materials and characteristics
  - ◆ Wall thickness
  - ◆ Pressure rating
  - ◆ Flow Rates
  - ◆ Air Release points/operational status
  - ◆ Coatings and Linings
- ◆ Bedding and backfill material
- ◆ As-built documentation
- ◆ Soil corrosivity, e.g. resistivity, pH, chlorides, moisture
- ◆ Adjacent utilities and crossings
- ◆ Sources of stray current corrosion
  - ◆ Nearby cathodic protection systems
  - ◆ Direct current powered transit systems
  - ◆ High voltage overhead AC power lines

# #2 - Indirect Inspection:

## Indirect Inspection techniques:

- ◆ In-Situ Soil Resistivity Measurements
- ◆ Soil Sample Collection and Analysis
- ◆ Ultrasonic Thickness Measurements (if applicable)
- ◆ Direct Examination of Exposed Pipe Sections
- ◆ Stray Current Evaluations

## #2 - Indirect Inspection:

- ◆ Integrate all data along pipeline alignment
- ◆ Analyze Data and Rank Indications:
  - ◆ Severe
  - ◆ Moderate
  - ◆ Minor
- ◆ Select at sites for direct inspection – locations should be where corrosion activity is most likely
- ◆ Select control site where corrosion activity is the least likely

# #3 - Direct Examination

- ◆ Excavating the pipe
- ◆ Performing physical inspection & photograph
- ◆ Evaluating integrity of coating/wrap, if present
- ◆ Testing the pipe surface, e.g. corrosion pitting
- ◆ UT measurements
- ◆ Measuring dimensions of corrosion defects
- ◆ Analyzing surrounding soil / groundwater
- ◆ Performing root cause analysis

# Force Main Pipeline Inspection Report

Inspector name \_\_\_\_\_ Date \_\_\_\_\_ Address of pipeline inspection \_\_\_\_\_ Leak? Yes \_\_\_\_\_ No \_\_\_\_\_ File Number: \_\_\_\_\_

- 1) Type of Pipe: cast iron \_\_\_\_\_ ductile iron \_\_\_\_\_ carbon steel \_\_\_\_\_ copper \_\_\_\_\_ carbon steel \_\_\_\_\_ non metallic \_\_\_\_\_ concrete \_\_\_\_\_ other \_\_\_\_\_
- 2) Diameter of pipe \_\_\_\_\_" Pipeline Name \_\_\_\_\_ Service Type: Water \_\_\_\_\_ Wastewater \_\_\_\_\_ Estimated date of pipe installation \_\_\_\_\_ Depth of pipe \_\_\_\_\_'
- 3) Type of Pipe: Distribution \_\_\_\_\_ Transmission \_\_\_\_\_ Service \_\_\_\_\_ Hydrant \_\_\_\_\_ Mechanical joint \_\_\_\_\_ Fasteners \_\_\_\_\_ Other \_\_\_\_\_ Unknown \_\_\_\_\_
- 4) Type of Coating: Polyethylene Encased \_\_\_\_\_ Shop applied coating \_\_\_\_\_ No Coating \_\_\_\_\_ Tape Wrap \_\_\_\_\_ Unable to determine \_\_\_\_\_
- 5) External Pipe Condition: Very Good \_\_\_\_\_ Good \_\_\_\_\_ Poor \_\_\_\_\_ comments: \_\_\_\_\_

6) Ultrasonic Thickness Measurements and comment \_\_\_\_\_ Internal Lining Present \_\_\_\_\_ Yes \_\_\_\_\_ No comment \_\_\_\_\_

6) Is corrosion pitting evident? \_\_\_\_\_ Yes \_\_\_\_\_ No Number of Pits \_\_\_\_\_ Typical Size of Pits \_\_\_\_\_ Quantity of pits: \_\_\_\_\_

7) Is graphitization evident (longitudinal or circumferential breaks) \_\_\_\_\_ Yes \_\_\_\_\_ No

8) Is the pipe installed in (check off appropriate items): Industrial area \_\_\_\_\_ Residential area \_\_\_\_\_ Rural area \_\_\_\_\_ Near street or road \_\_\_\_\_  
Near creek or waterway \_\_\_\_\_ In reclaimed land \_\_\_\_\_ Near oil or gas pipelines \_\_\_\_\_ Near high voltage lines \_\_\_\_\_.

8) Describe soil conditions where inspection occurred: wet \_\_\_\_\_ dry \_\_\_\_\_ clay soil \_\_\_\_\_ rocky soil \_\_\_\_\_ cinders \_\_\_\_\_ other \_\_\_\_\_

9) Where soil samples obtained, sealed and analyzed for chlorides, moisture content, pH, sulfides, resistivity? If yes results were: \_\_\_\_\_

10) Were previous repairs made on the pipeline (leak clamps, etc) Yes \_\_\_\_\_ No \_\_\_\_\_. Was new pipe installed \_\_\_\_\_ Yes \_\_\_\_\_ No.

11) Was a repair clamp installed on the pipe during inspection \_\_\_\_\_ Yes \_\_\_\_\_ No

12) Was a galvanic anode installed as part of the inspection process? \_\_\_\_\_ Yes \_\_\_\_\_ No, if yes size and quantity

13) Please relay additional comments:

14) Plan of Action \_\_\_\_\_

15) Insert digital photos below:

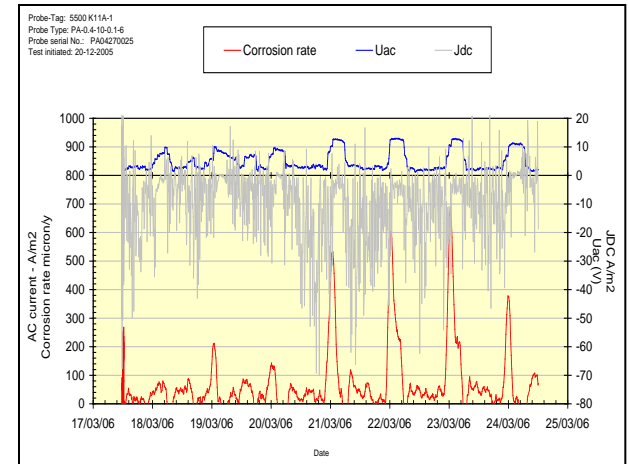

## #3 - Direct Examination:

- ◆ When corrosion is found, perform a root cause analysis
- ◆ Implement localized corrosion protection
- ◆ Install instrumented test station for future assessment of corrosion activity, e.g. corrosion rate probes

# #4 – Post Assessment:

- ◆ Calculate remaining life
  - ◆ Pit growth rate and wall thickness
  - ◆ Internal or External Corrosion
  - ◆ Coupons
  - ◆ Electrical resistance (ER) probes
- ◆ Maximize benefit by
  - ◆ Capture ideas for improvement
  - ◆ Determine need/timeframe for update evaluations
  - ◆ Identify corrective action options

# #4 – Post Assessment Recommendations:

- ◆ Identify Corrective Options
  - ◆ Operational Procedures
  - ◆ Treatment Practices
  - ◆ Internal Lining
  - ◆ Cathodic Protection
  - ◆ Stray Current Mitigation
  - ◆ Pipeline Replacement
  - ◆ Pipeline Monitoring

# Program for Existing Mains

## Break Reduction Life Extension Through Cathodic Protection

Anode Lead Wire Connection

Galvanic Anode

Pipe

Metallic Coupling

# Cathodic Protection of Metallic Fitting

# Meter Vaults

*(Keep dry if possible)*

## *Impressed Current CP System on Oil/Gas Lines can Create Stray Current Problem on Water Lines*

# Summary

- ◆ Effective management of force mains pipeline includes understanding and managing the risk of corrosion
- ◆ A systematic approach to condition assessments results in the most value at the lowest cost
- ◆ Retrofitting with accepted industry practice such as internal linings, treatment programs, operational adjustments, or cathodic protection may be a cost effective options for extending the life of existing mains
- ◆ A key asset management strategy is to include suitable corrosion control in the design of new force mains

# Prioritizing Distribution Systems

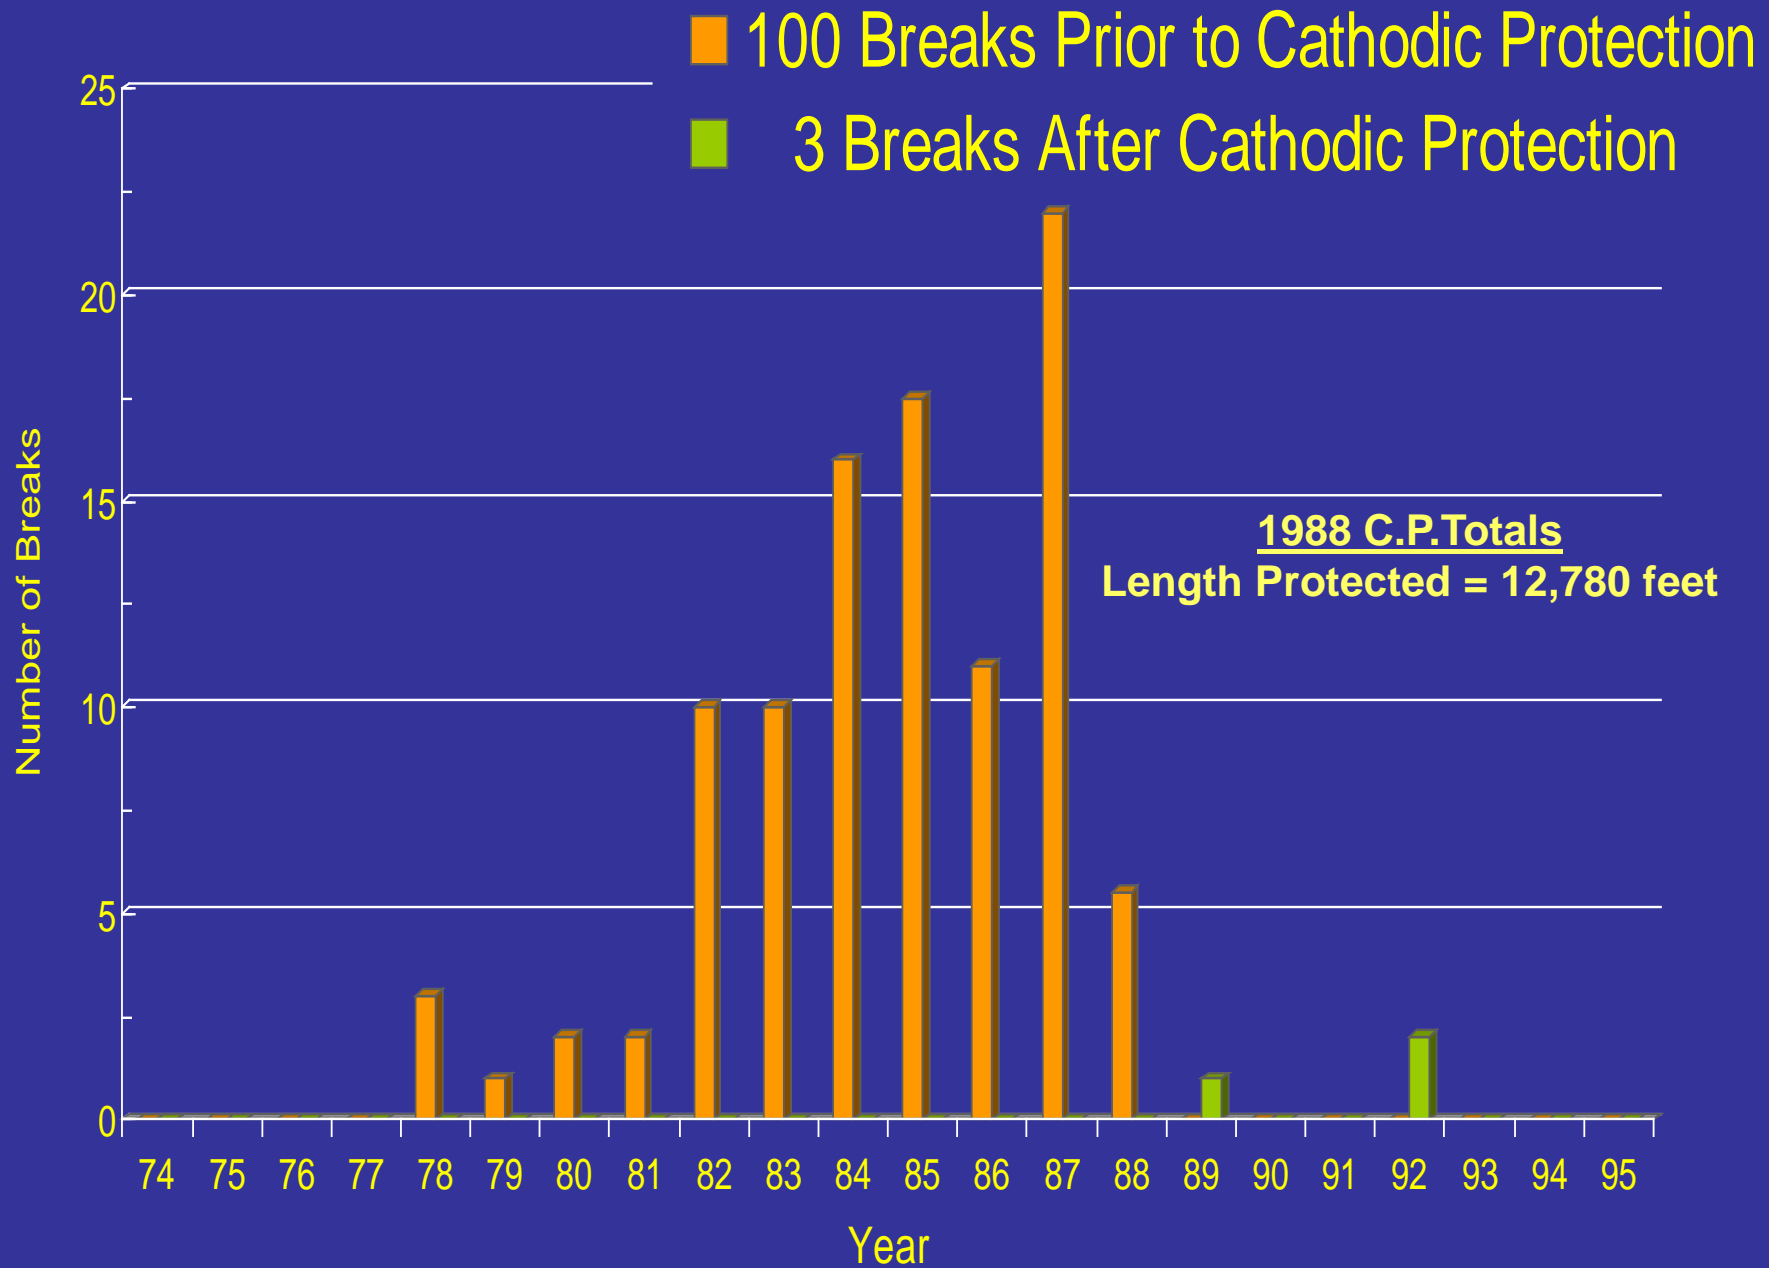

# ***Program for Existing Mains***

## ***Break Reduction Life Extension Through Cathodic Protection***

### **Anode Installation**

# Copper Service Connections

# Stray Current

# Polyethylene Encasement of Ductile Iron Pipe

- Follow DIPRA installation procedures
- Clean pipe before installing polywrap
- Repair tears or damage to encasement
- Engage an inspector to oversee installation

# *Insituform*

***corrpro***<sup>®</sup>

## *Repair of Break Should Include Anode Installation*

**corrpro**<sup>®</sup>

**Completed Repair**

Lower Stress Area  
(Cathode)

Pipe

Threaded Bolt  
Higher Stress Area  
(Anode)

Metallic Coupling

# Stress Corrosion

# Polyethylene Encasement of Ductile Iron Pipe

- Follow DIPRA installation procedures
- Clean pipe before installing polywrap
- Repair tears or damage to encasement
- Engage an inspector to oversee installation

# Force Main Recommendations

- ◆ Use coatings and cathodic protection for external corrosion control of steel and ductile iron pipe
- ◆ Replace pipe at failure sites with PVC, HDPE or fiberglass
- ◆ For long sections of deteriorated pipe, replace with PVC, HDPE or fiberglass, or, internally line with cured in place polyester resin (CIPP)
- ◆ Where metallic piping must be used, line with ceramic epoxy.

# Effectiveness of Well Designed Corrosion Management Programs

# Value of Well Designed Corrosion Management Programs

## Benefit to Cost Ratios (\$ saved/ \$ spent):

City of Houston, TX	8
Marin Water District, CA	9
East Bay MUD, CA - All Facilities	7
East Bay MUD, CA - Steel Pipelines	24
Chicago Area Utility	25

## Existing Force Mains:

- ◆ Internal Corrosion is likely the leading cause of main breaks
- ◆ External Corrosion may also be a factor

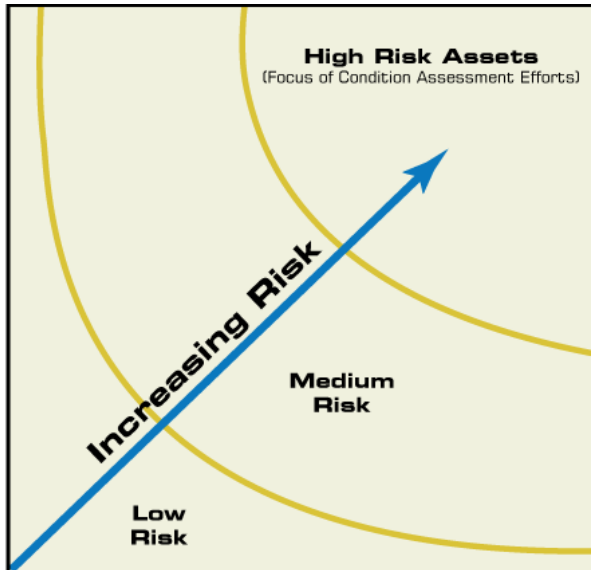

## #2 – Indirect Inspection: Non-Invasive Over-the-Line Techniques

# Existing Force Mains: Condition Assessment

...need to cost effectively understand and manage pipeline condition and operational risk...

		Criticality				
		Scale	1	2	3	4
Condition	5				Objective 1: Thorough Understanding of High Risk Regions	
	4					
	3					
	2		Objective 2: Cost Effective Field Evaluation			
	1					

# The four fundamental elements of a successful coating system involve:

1. Material Selection
2. Specification
3. Application
4. Inspection

# Technologies

---

- ◆ Material Selection
- ◆ Protective Coatings
- ◆ Cathodic Protection
- ◆ Stray DC Current Control
- ◆ AC Interference Mitigation

# 24" DIP

- ◆ Multiple failures at Buffalo Bayou on bottom of pipe
- ◆ Performed ultrasonic thickness measurements in lift station
- ◆ Cases of failure are scouring and turbulent flow

# Force Main Corrosion Mechanisms

# 30" Ductile Iron

- ◆ Internal corrosion failure at crown of pipe.
- ◆ Hydrogen sulfide gas formed sulfuric acid which attacked the mortar coating and then the underlying metal surface.

# *H<sub>2</sub>S & Silt Accumulation May Cause Internal Corrosion Problem....*

# Piping Inspection Phases

1. Identification of Problem or High Consequence Areas
2. Field Study/Inspection
3. Post Assessment/Identify Corrective Options

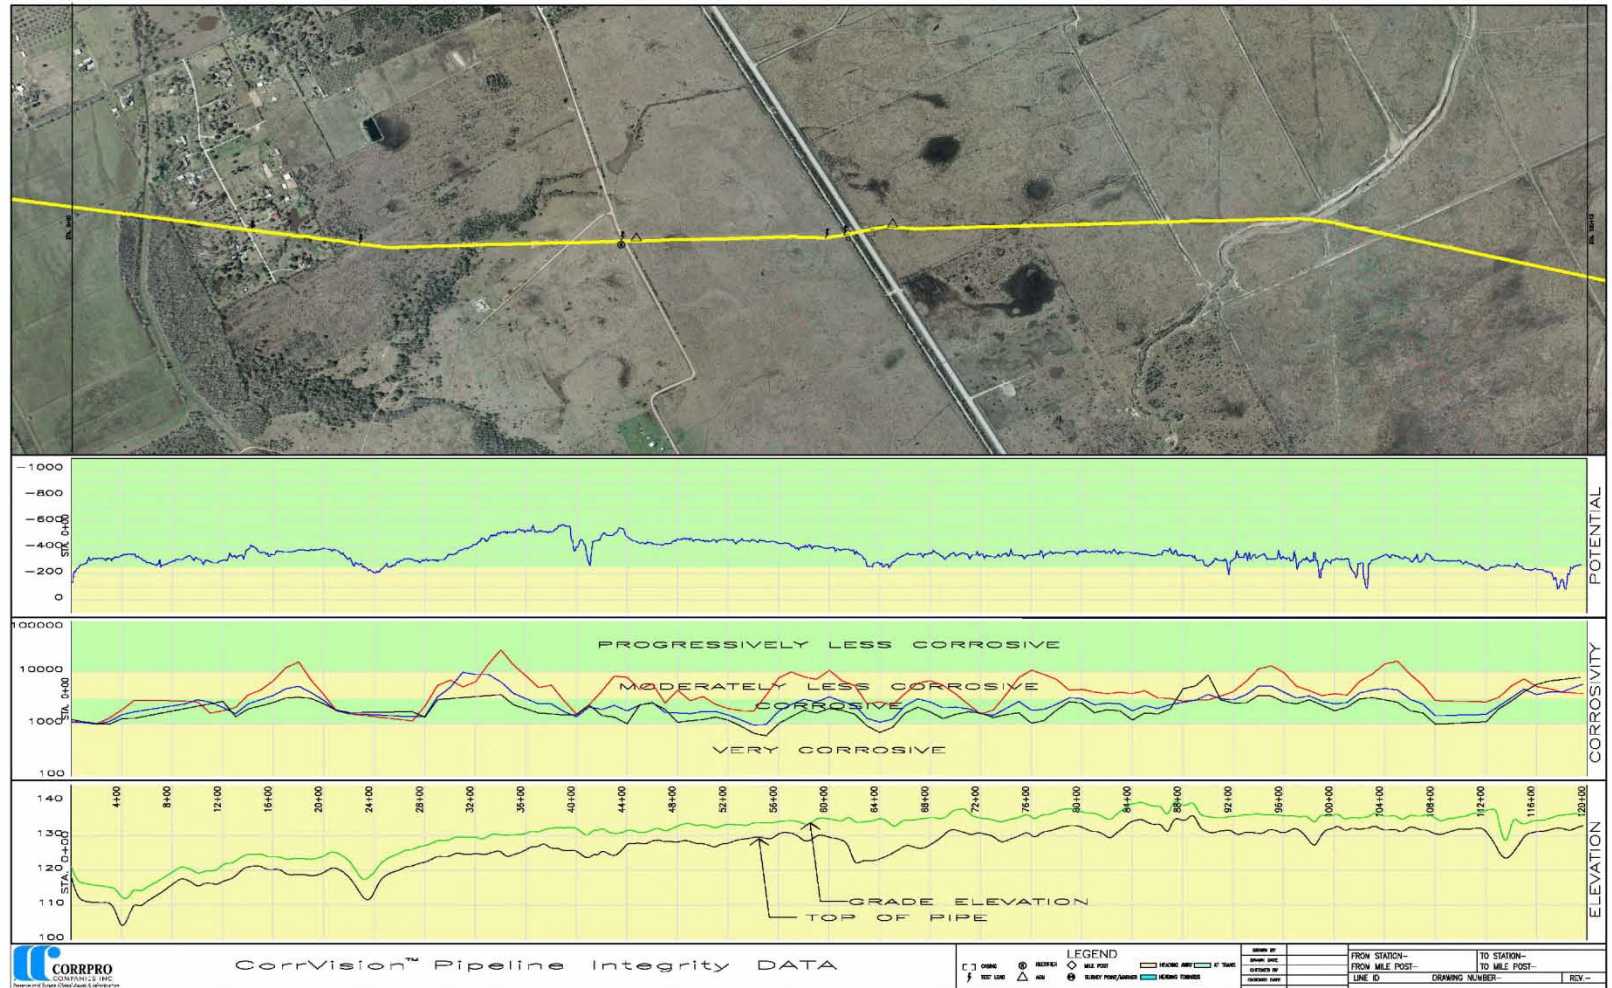

# Accurate leak records are an invaluable predictive tool

# #2 – Indirect Inspection:

## Data Integration for Non-Invasive Over-the-Line Techniques

## #2 - Indirect Inspection:

Available decision-assisting tools, among others:

- ◆ DDM™ – Risk-based “Design Decision Model”
- ◆ MTCF<sup>SM</sup> – “Mean Time To Corrosion Failure” Predictive Model

## **#3 - Direct Examination:**

- ◆ Excavating the pipe
- ◆ Performing physical inspection
- ◆ Evaluating integrity of coating/wrap, if present
- ◆ Ultrasonic Testing of the pipe surface
- ◆ Measuring dimensions of corrosion defects
- ◆ Analyzing surrounding soil / groundwater
- ◆ Obtain coupon
- ◆ Performing root cause

# 24" DIP & Steel

- ◆ Internal pipe failures along crown of pipe
- ◆ Failures following loss of internal mortar lining
- ◆ Cause is formation of hydrogen sulfide gas

## **#3 - Direct Examination:**

Procedures for data collection

- ◆ Physical Examination
- ◆ Photographic Documentation
- ◆ Pipe-to-Soil Potential Measurements
- ◆ Bi-metallic Connections, e.g. services
- ◆ Soil, Bedding, Backfill and Groundwater Tests
- ◆ Coating Assessment (if applicable)
- ◆ Mapping and Measurement of Corrosion Defects
- ◆ Ultrasonic Thickness Measurements
- ◆ AC and DC Stray Current Measurements
